WhatsUnity

WhatsUnity is a comprehensive mobile platform designed to bridge the gap between property management and resident connection. Unlike standard group chats, WhatsUnity creates a structured, verified environment where every interaction is mapped to a specific building and apartment unit.

Built with Flutter and powered by a self-hosted Supabase backend, this application solves the chaos of unverified tenants and lost information. It introduces a dedicated "Brainstorming" governance module that separates critical decision-making polls from daily chatter, ensuring community voices are heard clearly.

🚀 Key Highlights 📍 Structured Identity: Residents are verified by Building & Apartment ID, ensuring you always know who your neighbors are.

🧠 Brainstorming Module: A dedicated space for voting and polling, preventing critical community decisions from getting buried in chat streams.

🛠️ Unified Services: One-tap reporting for Maintenance, Security (Lost & Found), and Care Services.

🔐 Role-Based Access: Distinct interfaces and permissions for Owners, Tenants, Security Managers, and Admins.

☁️ Robust Backend: Powered by Supabase (Docker/Edge Functions) for real-time chat, secure auth, and media handling via Google Drive.

MainScreen

Sign Up/Sign in

- sign in using Email address or using Google Account
- members selects a community from list to join
-
  - upload proof of Resident (owner - rental)
-
  - building number and apartment number
